AI Management Trainee’s Assignment

The situation

Every Monday morning, our hotel partners want to see how they performed the previous week — bookings, revenue, how they tracked against goals. Today, someone on the team has to pull the data, analyze it, and write up a summary by hand for each hotel. It's slow and easy to get wrong.

Your task

Design and build a system that does this automatically:

- Pull last week's performance data (from the Google Sheet linked below)
- Decide which hotels are doing well vs. need improvement
- Generate a personalized summary message for each hotel
- Send it to the hotel owner (use your own email to test)

Use any tools or languages you like — pick what you think fits the job best.

Attached File: Mock database

- Google Sheet

What to submit

1. A working version of what you built
2. A short write-up explaining: why you chose the tools you did, how you decided the "good vs. needs improvement" thresholds, and how you designed the AI to write the messages
